People with these symptoms often assume they are caused by external irritants, or that they are just part of life. In fact, Dry Eye Disease occurs when your eyes do not produce enough tears or produce poor-quality tears. This can happen for a number of reasons, including aging, hormonal changes in women, side effects of diseases or medications, and other causes.

That’s why it’s essential you get your tears analyzed by your eye doctor. Only an eye doctor can properly diagnose your problem and treat it appropriately.

Your eye doctor will take a sample of tears from each eye and use the TearLab to measure osmolarity. (The sample required is very small, thanks to TearLab’s advanced technology; your doctor will need an amount no larger than the period at the end of this sentence.)

Osmolarity is the accepted standard for diagnosing Dry Eye Disease. The TearLab Osmolarity Test will give your doctor a meaningful measurement of the health and stability of your tear film.

“MY NUMBER WAS 323.”

Once your eye doctor has determined your osmolarity number using TearLab, he or she can design a treatment regimen tailored to your specific condition.

Ask your doctor about the TearLab Osmolarity Test.
